

SOCIOMETRY ASSESSMENT

EXPT NO: _____

GROUP EXPT _____

DATE : _____

INTRODUCTION:

Sociometry is a research and assessment method used in sociology and psychology to study and analyze social relationships and social networks within groups. Sociometry aims to measure and understand interpersonal connections, preferences and dynamics within a group or community. It provides insights into social structures, group cohesion and the distribution of social interactions.

Sociometry assessment measure the attraction or repulsion within a given group. The relationships, network ties or sociometric criteria can be emotional or reputational. It enables to learn about the group dynamics and evaluate socialization levels of students or group or a community.

Sociometry can be used as a scale or technique of measurement in which at least a group consisting 5-6 members are asked to select or choose members of the same group based on specific criteria. From the choices a description emerges the new works inside the group. With the help of these choices or preferences a drawing like a map of these choices or a graph that depicts the relationships among individuals in a group in order to map the group's social network is called social network - Sociogram. The data for the sociogram may also be displayed as a table or matrix.

matrix of each person's choices. Such a table is called a Sociometric matrix. The concepts of Sociometric Stars, mutuals, cliques/chains, isolates sociomatrix and rejected. These help to describe the social dynamics.

Star: In Sociometric context, one central individual is connected to several other individuals and the person whose value is selected by maximum members of the group.

Mutuals are the relationship in which two individuals have reciprocal or bidirectional connections with each other.

Gang refers to a group of individuals who are closely connected to each other within a larger social network but are well integrated with outside individuals.

Isolated: Isolated individuals are those who have limited or no connections with others in a social group.

Rejected: Rejected individuals are those who actively experience negative interactions and social disapproval within a group.

Cliques : They are tightly-knit subgroups within a larger social network where all have direct connections with every other member of the sub-group. They have strong cohesion.

Sociometry is used to measure individual characteristics such as leadership, aggressiveness etc.

It is useful or applied in the field of Industry, Education, Army etc. This is more useful in small groups. This is very simple, economical and natural method of observational and data collection.

This can be employed in a wide variety of research in the laboratory as well as in the field. Sociometry assessment used in educational settings to address issues like bullying, in therapy to improve group dynamics and in organizational contexts to enhance team

Aim

To measure the extent of association the participant has with his/her fellow members.

METHOD:

A Participant's Profile:

Names: A, B, C, D, E, F, G, H, I

B. Experimenter's Profile:

Name: RMR

Age : 44

Gender : Female

Educational Qualification : Bsc Bed.

b) PLAN OF THE TEST:

A group of participants are asked to answer a question. From their answers, star, isolated, mutuals, gang and cliques are found out and sociometric matrix and sociogram are drawn.

C. ADMINISTRATION:

A group of 9 participants is organised or arranged. They are asked to answer the question "Whom do you prefer in the group?", without any discussion. The answer sheet is kept confidential.

The members of the group are called A, B, C, D, E, F, G, H and I, which will be assigned by the administrator and will not be disclosed to the group. So who prefers whom will not be revealed to others.

After obtaining responses from everyone in the group, sociometric chart may be drawn for the question based on the responses received. The matrix and sociogram are analysed to find the star and the

isolated of the group. Also check whether mutuals, cliques, isolated, gang and rejected are present. The responses should be kept confidential.

RESULTS:

A Sociogram is drawn based on the responses of the participants and is depicted in the sociometric chart.

From the chart, the following can be inferred.

Star - C

Isolated - I

Clique - B, C, D

Gang - E, F, G, H

Rejected - A

Mutuals - CD, EF, HG, GE, BD, CB, CH, EH, GF, FH

DISCUSSION

The aim of the test was to measure the extent of association of the participant has, with his/her fellow members and the result shows that C is the star I is the isolated and A is the rejected.

From the Sociometric analysis C is the star, I is the isolated, B, C, D are the cliques, E, F, G, H are the Gang and A is rejected. The mutuals are found to be CD, EF, HG, GE, BD, CB, CH, EH, GF and FH.

C is the star because he/she is the central person who is connected to all the others. They may have effective communication skills. They are well liked by the other persons, they can exert significant influence on a group. The persons who were selected as cliques may

interact with one another regularly and consistently, and thus forming strong bonds between them. They provide emotional support and are having high degree of cohesiveness. 1 is isolated may be due to the feeling of loneliness, may be of limited social contact, communication with others may be infrequent or limited and also may be due to the family circumstances and also due to health problems. The persons who selected as gang are have strong cohesion, they often share common identity or features may be for protection or a sense of belonging. A is selected as Rejected because that person may experience social exclusion from peer groups they may experience emotional distress including anxiety. They may feel uncomfortable to interact or to communicate. The mutuals are of equal and balanced popularity in the peer group. They may characterised by give and take. They may navigate various social situations with ease. Their opinions may valued. They may have very good mental health.

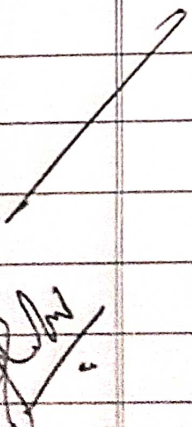

To improve the group relationship among the members, involves understanding the social dynamics within the group and implementing strategies to enhance collaboration and effectiveness. Stars can help pinpoint where to focus efforts as they have connections with others. Encourage open and effective communication within the group. Avoid creating cliques or exclusive subgroups within the group. Conduct team building activities to strengthen interpersonal relationships. Respect the diversity of personalities and communication styles with the group. Provide leadership training to individuals show potential for influence

within the group. Define clear and achievable goals for the group. Assign specific roles and responsibilities to each team member. Develop conflict resolution strategies. By fostering a positive team culture, implementing effective management and leadership practices to achieve the desired outcomes.

CONCLUSION

With the sociometric assessment star, rejected, isolated, cliques, gang and the mutuals were identified.
